

Recycling of spent Auto Catalytic Converters: Smelting Technologies Development

ReMetall Deutschland AG

Prague Seminar 2017

Leadership through innovation since 1996

1996
zero loss
dismantling

1998
metal carrier
processing

2002
inhouse lab

2005
innovative
homogenisation
and sampling

2015
melting plant

Motivations for concentrating precious metal through smelting

Rampant sampling inaccuracies for lack of industry standards

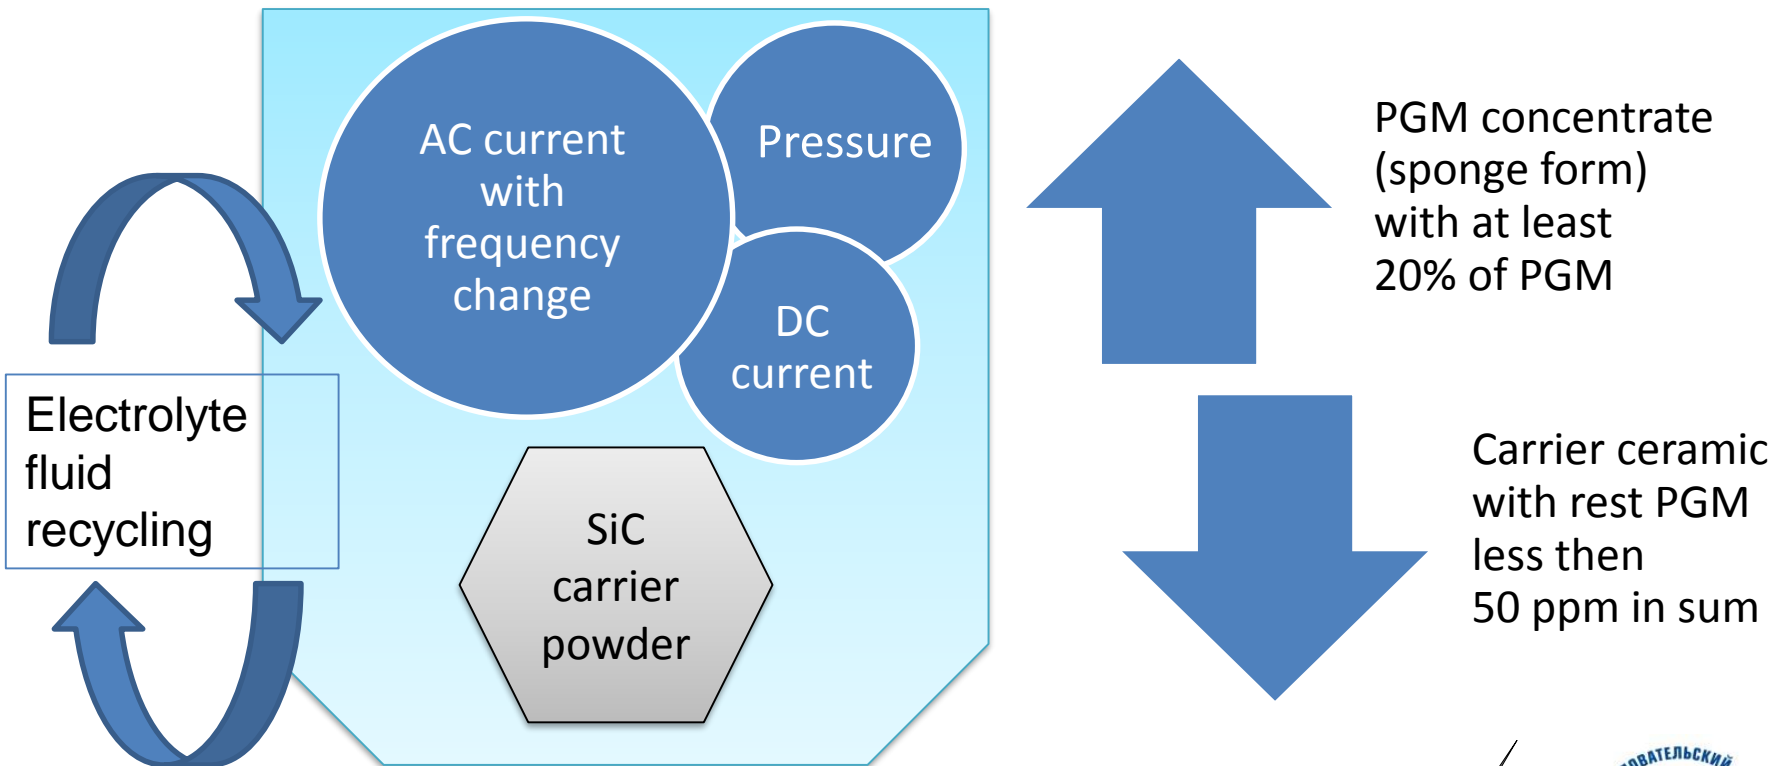

Huge logistics expenses when 99.7% of material moved is worthless dead weight

Optimized yield and greater process control through smelting

Advantages of direct current arc smelting

New Project: Improving of classical electrochlorination method applicated for extraction of PGM from spent autocatalyst with high SiC content

Pre research provided by Antonov A., Samotaev N., NRNU MEPhI (Moscow Engineering Physics Institute), was supported by the Ministry of Education and Science of the Russian Federation

(Grant No. 14.575.21.0153, unique identifier RFMEFI57517X0153)

Looking ahead: challenges for the recycling industry

Forecast

Forecast

- The amount of material to be recycled in the next 10 years will rise significantly.

Limits

- By 2026 the supply of recyclable material could support 120 smelting operations.

Business

- Starting in 2018 ReMetall Deutschland AG will be able to supply smelting technology and supporting operational know how.

Thank you for your time and attention
